DIPLOMA THESIS

Documentation

| | |
|-------------------------------|---|
| Author(s) | Niklas Graf Lukas Knoll Sebastian Mandl |
| Form Academic year | 2017/18 |
| Topic | AEMS – Advanced Energy Monitoring System |
| Co-operation partners | Energiegenossenschaft Region Eferding |

| | |
|----------------------------|---|
| Assignment of tasks | <p>Development of a bot which extracts data from AMIS-meters and stores it in the database of the AEMS-System.</p> <p>Define customized meters for instance electricity-meters, heat-meters and many more and set them up on your personal Raspberry-PI.</p> <p>The entirety of data will be processed and displayed as statistics. Furthermore, the generation of reports which specify time constraints are possible as well. The aforementioned functionalities also provide download capability.</p> <p>Additionally, the detection of anomalies is provided by an integrated scripting language called AEMS-scripting-language (AEMSSL). The main aim of the scripting language is the detection of deviation of consumption values either caused by meters themselves or sensors affecting the meters values (day-time, light-intensity).</p> <p>Moreover, an integrated notification system supports easy recognition of abnormal meter data.</p> <p>Development of an android-app to display priorly defined and generated statistics. The android-app also comes along with the download capability of statistics and notifies the user if abnormal meter data is noticed by the system.</p> <p>Administrative tool for the management of access rights to the system.</p> |

| | |
|--------------------|--|
| Realisation | <p>Android app development was supported by the IDE Android Studio V.2.3. For the generation of statistics the MPAndroidCharts library was consulted. The communication between the server and the client is managed by a REST-API as well as by a self-created library AEMS-API-LIB. Every further functionality found in the android-app was entirely self-created.</p> <p>Creation of the web-interface was supported by several libraries namely CSS, Bootstrap. Additionally, modals were created by the help of clean-modal-</p> |

| | <p>login-form.</p> <p>The language in which the web-interface was designed was chosen to be XHTML and was utilized in conjunction with Java-Server-Faces (JSF). Moreover, jQuery and JavaScript were used to implement further functionality.</p> <p>The library which grants the display of statistics is named Chart.js And the one which provides the capabilities for downloading PDFs is named jsPDF.</p> <p>The web-interfaces supplies the user with the possibility to display the desired statistics which the user wants to have immediate access to as well as to define quick statistics. These statistics can furthermore be subject to download or configuration. Possible configuration would be to only let the statistic appear on the smartphone app or to declare time constraints on reports or statistics to only receive reviews of periods that the user demands. In Addition, guidelines for the detection of anomalies can be specified which will be taken under advisement by the unit which is accountable for processing the data received from the meters and sensors (AEMSSL).</p> <p>The administrative tool was also chosen to be designed with XHTML, jQuery, JavaScript, JSF and Bootstrap. This tool permits the administration of access rights hence the declaration of new administrators and moreover to specify the exact geographical realms where the administrators operate in.</p> <p>PostgreSQL-Database as a means of data storage.</p> <p>The report-bot is in charge of downloading the data from the NETZONLINE-page which then gets stowed in the database of the system. This program was entirely implemented with the JAVA programming language. In order to had implemented the communication with the NETZONLINE-page a special library named HTMLUnit was consulted. For the extraction of the data from the excel files which were downloaded by the report-bot another library named Apache POI was utilized.</p> <p>A Java REST-API enables the communication between the database and the several clients. The aforementioned REST-API provides a logical layer for all database requests performed via GraphQL to guarantee a never changing communication protocol.</p> <p>With the utilization of a Raspberry PI the data of various different meter types is able to be read from. After the read the data is transmitted to the database via the REST-API which then is responsible for creating the proper SQL statements to store the data properly in the database. The acquisition of meter data is performed by a Plugin-System which is capable of dynamically including user-defined Plugins into the processing environment.</p> <p>In conjunction with home automation an interface to Open-HAB was established. Via this interface it is possible for the user to retrieve the current meter value from the server and to display it.</p> |
|--|---|

| | |
|----------------|---|
| Results | Functional report-bot, which retrieves data and stores it in the database. Functional client/server infrastructure between the utilized services. Functional services are web-interface, administrative tool, android-app, Raspberry PI meter data extraction, aems-apilib, database and Java REST-API. Every functionality demanded by the customer was satisfied. |

(incl. explanation)**

Wochenstatistik

| Tag | Verbrauch (kWh) | Verbrauch (Vorperiode) (kWh) |
|------------|-----------------|------------------------------|
| Montag | 130 | 250 |
| Dienstag | 180 | 120 |
| Mittwoch | 190 | 110 |
| Donnerstag | 220 | 250 |
| Freitag | 110 | 280 |
| Samstag | - | - |
| Sonntag | - | - |

Dashboard. On the top one can find the navigation bar with the menus, the user and the notification system. The content of the page itself is comprised of user selected statistics which are available for download.

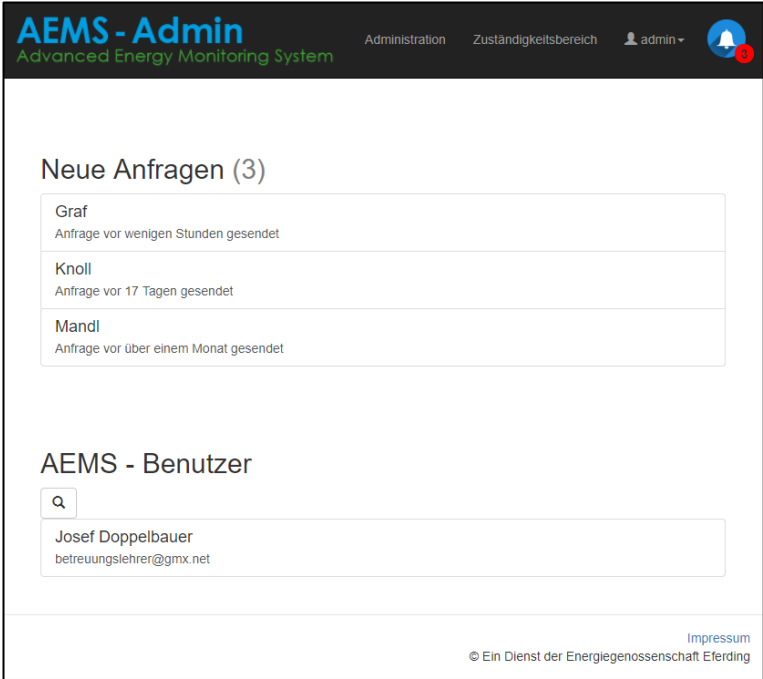

Stromstatistik 2

| Datum | Außentemperatur | Aktueller Verbrauch | Verbrauch Vorperiode |
|-------|-----------------|---------------------|----------------------|
| 12/1 | 3.5 | 2.0 | 2.0 |
| 12/2 | 4.5 | 6.0 | 6.0 |
| 12/3 | 5.5 | 4.0 | 4.0 |
| 12/4 | 6.5 | 7.0 | 7.0 |
| 12/5 | 5.5 | 4.0 | 4.0 |
| 12/6 | 4.5 | 3.0 | 3.0 |
| 12/7 | 3.5 | 7.0 | 7.0 |
| 12/8 | 4.5 | 2.0 | 2.0 |
| 12/9 | 5.5 | 6.0 | 6.0 |
| 12/10 | 6.5 | 4.0 | 4.0 |
| 12/11 | 5.5 | 3.0 | 3.0 |
| 12/12 | 4.5 | 7.0 | 7.0 |
| 12/13 | 3.5 | 2.0 | 2.0 |
| 12/14 | 2.5 | 7.0 | 7.0 |
| 12/15 | 1.5 | 2.0 | 2.0 |

View of a statistic in the android-app. On the top one can find the navigation bar which provides the functionalities of displaying the current notifications accessible by the user as well as layout changes. The view depicts a statistic with current consumption values and consumption values of the pre-period and the corresponding anomaly. Furthermore, there is the possibility to download the statistics.
